

Technology Acquisition Process – Narrative Description

The procurement process begins with the **Manager** documenting the need for acquisition. This task is guided by the **Procurement SOP** and the **Procurement Justification Template**. The **Procurement Manager** supports this step by providing necessary information and templates.

Once the need is documented, the **Chief Information Officer (CIO)** reviews the requirements project. If the project is approved, the process moves forward. If the project is rejected, the process ends, and no further action is taken. If the CIO needs clarification, the workflow returns to **Task 1** for rework, where the **Manager** and **Procurement Manager** address the CIO's concerns and provide additional information or adjustments as needed.

Next, the **Project Manager** takes on the responsibility of researching and documenting the requirements. The **Manager** supports this task by providing insights and feedback.

The **Project Manager** then reviews the requirements with the **Department Manager**. If the requirements document is approved, the process moves forward. If not, the proposal is sent back to the **Project Manager** in **Task 3** for rework. The **Project Manager** revises the requirements document based on the feedback and resubmits it for review.

Following the review, the **CIO** approves the project. If the project is approved, the process moves forward. If the project is rejected, the process ends, and no further action is taken.

The **Project Manager** develops the budget, guided by the **Procurement SOP** and the **Budget Template**. The **Procurement Manager** and **Chief Financial Officer (CFO)** support this task by providing financial data and ensuring the budget aligns with organizational goals.

With the budget in place, the **Project Manager** researches suppliers and vendors, following the **Procurement SOP**. The **Manager** and **Procurement Manager** assist by providing recommendations and previous supplier data.

The **Project Manager** then compiles a ranking against competitors using the **Ranking Criteria** and the **Ranking Template**. The **CIO** and **Procurement Manager** support this task by providing additional insights and data.

Based on the rankings, the **Project Manager** develops a short list of potential suppliers, guided by the **Procurement SOP**. The **Procurement Manager** and **Manager** assist in refining the list.

The **CIO** reviews the short list. If the short list is approved, the process moves forward. If the CIO does not find an acceptable vendor on the short list, control is returned to the **Project Manager** in **Task 9** to create a new short list. The **Project Manager**, with support from the **Procurement Manager** and **Manager**, develops a revised short list of potential suppliers that better meets the CIO's criteria.

The **Procurement Manager** contacts the vendors and suppliers on the short list, with the **Project Manager** and **Supplier** providing necessary information and coordination.

The **Project Manager** sets up demonstrations, trials, or webinars with the suppliers, supported by the **Procurement Manager** and the **Supplier**.

After the demonstrations, the **Project Manager** analyzes and categorizes the results, guided by the **Procurement SOP**.

The **Project Manager** reviews the results and lists the candidates with support from the **Procurement Manager** and the **CIO**.

The **CIO** selects the finalists, with input from the **Procurement Manager** and the **Project Manager**.

The **Procurement Manager** requests proposals from the finalists, with the **Project Manager** and **Supplier** providing necessary details and coordination.
